OBSERVATORY OUTLINE

Location

29° 50′ 13″ N 29.8369° N EL89qu
82° 37′ 17″ W 82.6214° W
53 ft (16 m) MSL

Antennas

TFD Array

Two square arrays on a NS line, eight 30-foot TFD elements, beam steering in 5° increments NS and 15° increments EW.

16 MHz HPBW at zenith: 18° NS x 40° EW
20 MHz HPBW at zenith: 15° NS x 35° EW, D ≈ 14 dBic
24 MHz HPBW at zenith: 12° NS x 30° EW
32 MHz HPBW at zenith: 8° NS x 20° EW
For more about the TFD Array, see: **The DPS and TFD Array**

Riometer Array

Standard Radio Jove dual-dipole array, 20′ element spacing, 12′ wire height, 23′1″ driven elements, 24′4″ reflectors 7′6″ directly beneath driven elements, no phasing (zenith beam steering).

20 MHz HPBW at zenith: 72° NS x 74° EW, D ≈ 8.3 dBi

Receivers

Dual Polarization Spectrograph (DPS)

24 x 7 x 365 unattended operation
16–32 MHz, simultaneous (correlated) RCP and LCP
300 channels per polarization (600 total)
Swept frequency, selectable 7.5, 15, 30, 60 kHz pre-detection BW
~ 6.7 sweeps/sec, integration time = 500 μs per sample
Frequency resolution = 53 kHz, Δt = 150 ms
For more about the DPS, see: **The DPS and TFD Array**

Receivers (cont'd)

Radio Jove Receivers

24 x 7 x 365 unattended operation
~ 20.1 MHz, uncorrelated RCP and LCP
7 kHz RF BW folded via direct conversion into a baseband
3.5 kHz pre-detection audio BW
Integration time = 100 ms per sample
For more about the Jove Receivers, See: **Radio Jove Receiver Manual**

Icom R8500 + 10.7 MHz Jove Receiver

24 x 7 x 365 unattended operation
20.1 MHz, East-West linear polarization
7 kHz RF BW folded via direct conversion into a baseband
3.5 kHz pre-detection BW
Integration time = 100 ms per sample

Tunable Wideband Receiver (TWB) Mark III

Attended operation only
Tunable from 16 to 32 MHz, RCP or LCP
2 MHz IF BW direct to high speed digitizer
FFT post-processing, RBW = 4.88 kHz, $\Delta t = 205\ \mu s$
For more about the TWB, see: **The TWB**

Sensitivity

Formal sensitivity calculations and measurements have not been made. A rough estimate considering only the number of dipoles is a 20 MHz on-axis and at zenith 3σ sensitivity on the order of 100 kJy. All receivers presently in use have noise figures between 6 and 8 dB, making their internal noise of little concern given the modest losses between the TFD array and the receivers and the fact that in the upper HF band, system noise is dominated by the galactic background emission.

Timing

All radio telescope data collection systems use a PC's internal clock to apply timestamps to the data. Each PC runs a service, Meinberg NTP daemon, to keep its system clock within a few milliseconds of UTC using Network Time Protocol (NTP). The NTP server is a GPS-ntp-pi stand-alone unit using GPS and GLONASS signals to determine and provide the correct time on the local network. Future work includes upgrading the spectrographs to a GPS-based hardware system with firmware modification to keep the start of each frequency sweep disciplined to within a hundred nanoseconds of UTC.
For more information, see: **GPS-NTP Pi**
For more information, see: **Meinberg NTP Server** and **Meinberg NTP Server Monitor**

Calibration

All radio telescope systems are calibrated in terms of antenna temperature using a noise source of known temperature calibrated against a 5722 noise diode. An automatic calibrator runs a step calibration on all receivers a fixed number of hours before and after Jupiter transit (usually 3 hours when Jupiter's elongation is < 90° and 4.5 hours when Jupiter's elongation is > 90°), every day. The step cal runs in 17 steps of 5 seconds each separated by 3 dB, ranging from 4.3 kK to 250 MK equivalent antenna temperature.
For more information see: **5722 Noise Generator**
For more information see: **AJ4CO Automatic Calibrator**

Computers

Three identical PCs are used to record data from the receivers. Each has a 2.4 GHz AMD Opteron dual-core processor, 4 GB RAM, and a 1 TB hard drive. All run Windows XP SP3. All are connected to the observatory LAN.

Internet

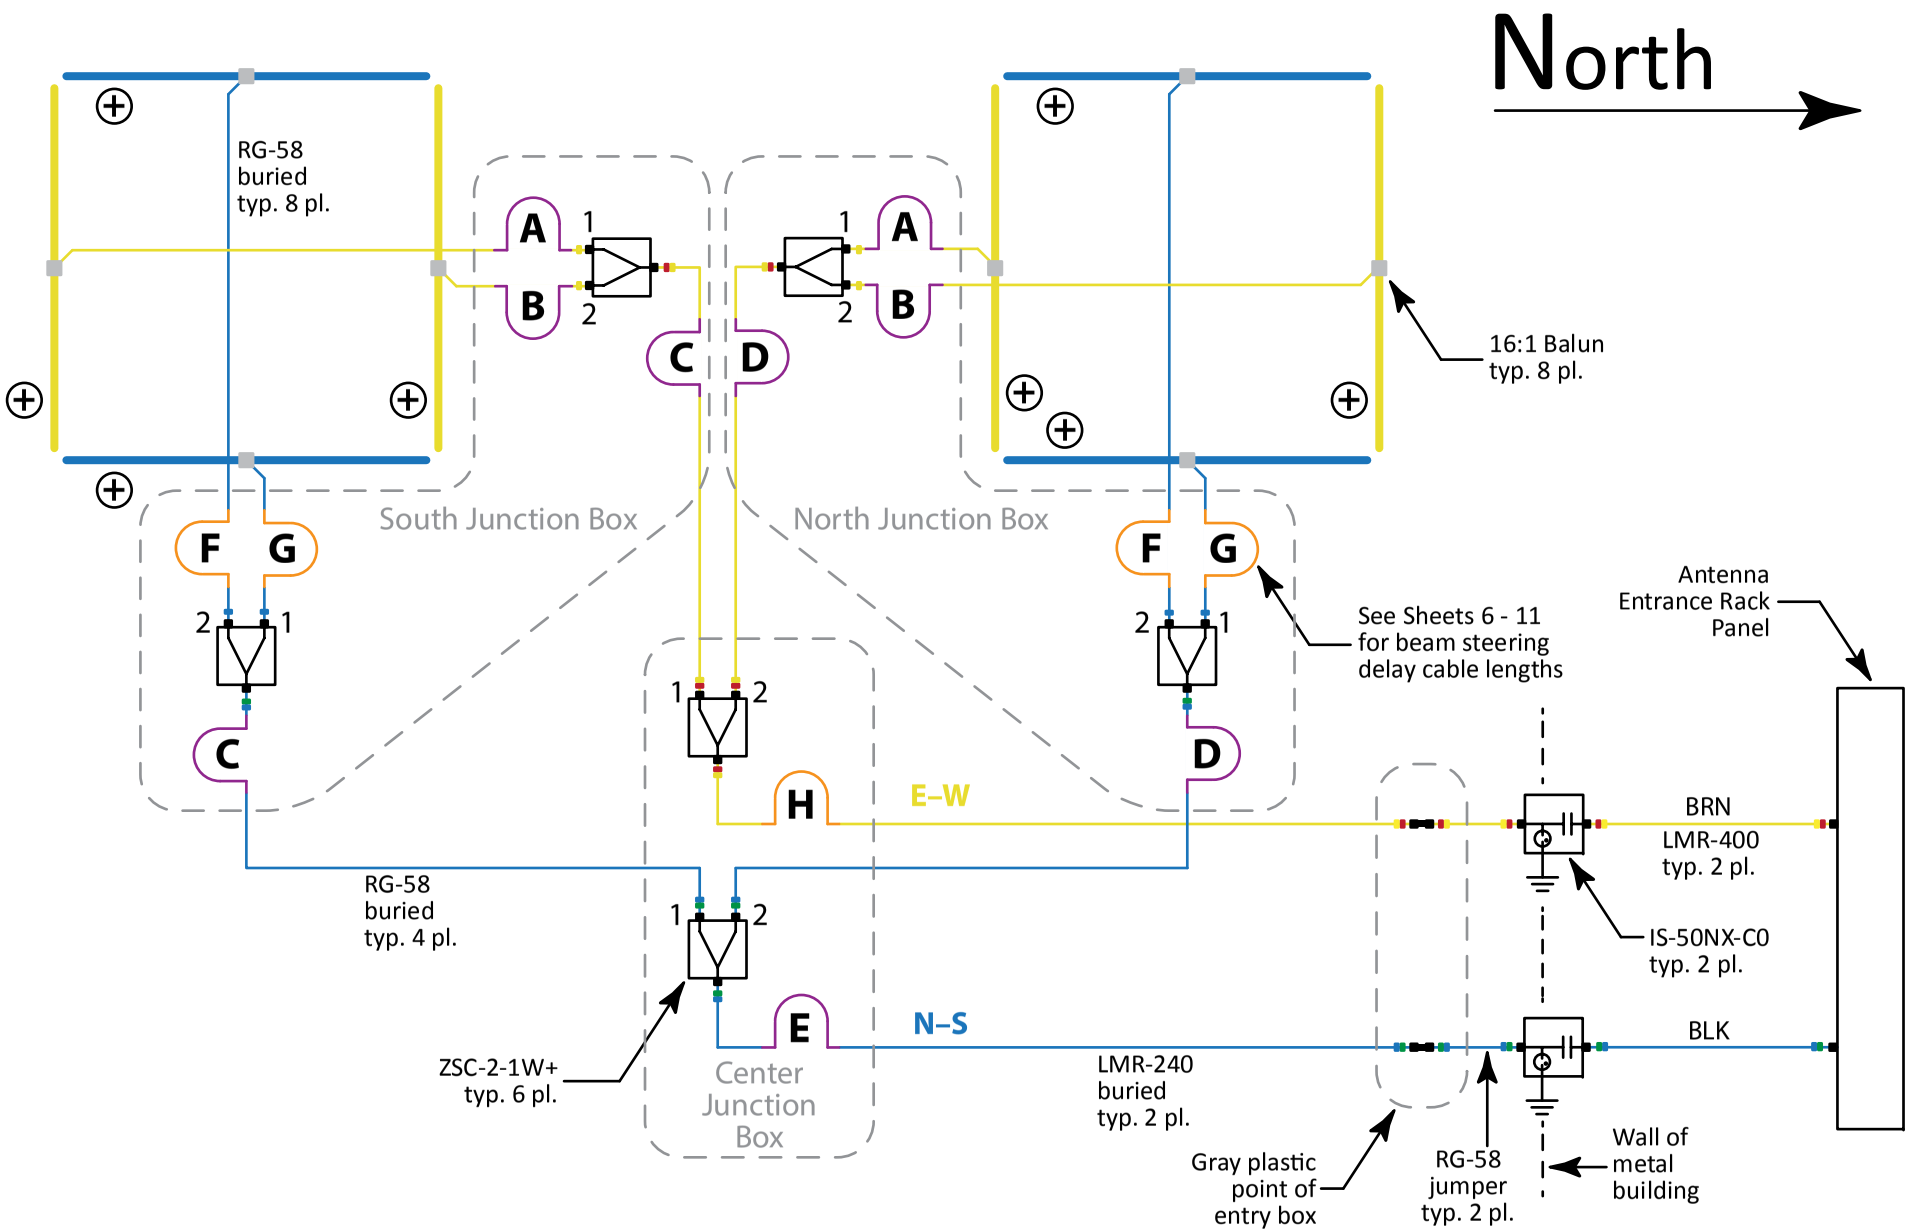
The observatory has internet access via a 6 Mbps DSL connection. This connection allows the Radio Sky Pipe (RSS) and Radio Sky Spectrograph (RSS) software to serve data to interested remote observers.

Power

The receivers, computers, and network hardware are fed by six 1.5 kVA battery backup units providing at least 15 minutes of power if the AC mains fail.

Operations

Several radio telescopes operate all day, every day (see "Receivers" above). Useful Jupiter observations are made any time Jupiter is within 3 hours of transit, but this is extended to around 4.5 hours when Jupiter's transit elevation is greater than 70° and Jupiter is near opposition.



30’ folded dipoles, top wire 9’2” height,
8” wire spacing, 32’ element spacing,
800 Ω termination resistors, 16:1 baluns.

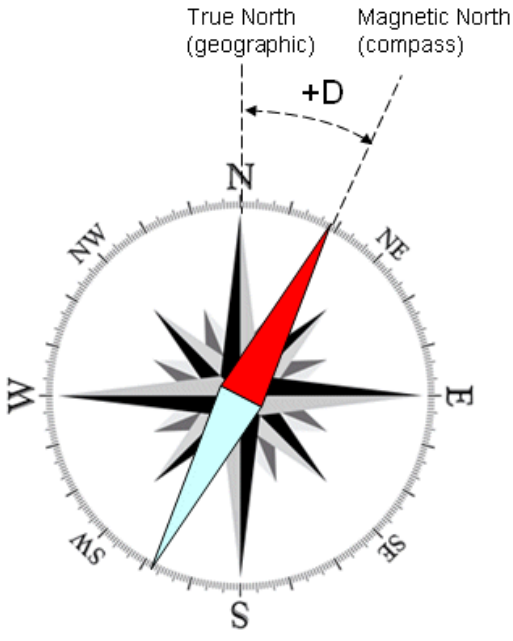
Negative declination (WEST)



Positive declination (EAST)

How can we calculate declination at any given place?

One way would be to use declination maps. Unfortunately because of secular variation, declination values are constantly changing. When printed maps were the only way of getting this information, the declination values were somewhat out of date by the time the maps got to the general public.

Another way would be to perform a prediction. This should be based on a world-wide empirical model of the deep flows. This web page operated by the National Geophysical Data Center (NDGC) offers a pretty good value for declination. The model reflects a highly predictable rate of change, and will usually be more accurate than a map, and almost never less accurate.

The best way however is to use **the current web site**, which offers in a graphical format using Google Maps API the computed declination for any place on Earth. The algorithm implements the World Magnetic Model WMM2015.
